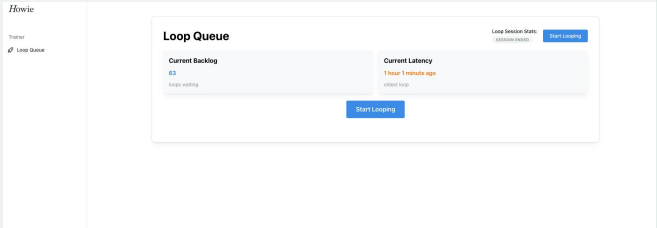
Loops Resolved Per Session	Tool Types Mastered	Accuracy Standard	Response Timer SLA

ROLE OVERVIEW

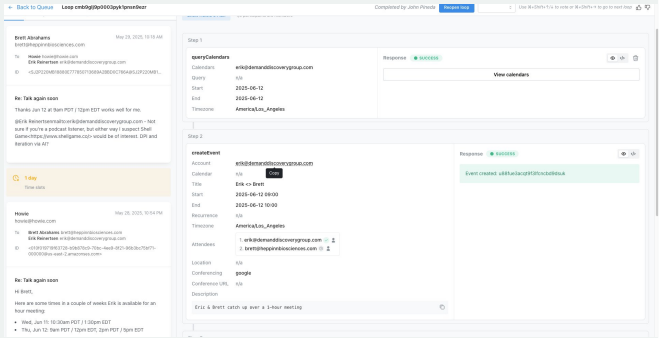
As an AI Analyst & Trainer at Howie, I reviewed and corrected AI-predicted scheduling actions — validating tool calls, calendar events, and client emails to ensure 100% accuracy before finalization. I collaborated daily with engineers, analysts, and fellow trainers via Slack to resolve bugs, triage loop backlogs, and continuously improve the AI's scheduling intelligence.

WORKFLOW IN ACTION



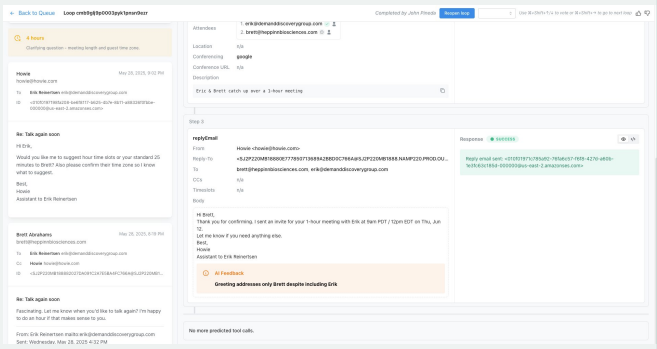
Loop Queue Dashboard

The central hub showing live backlog (63 loops) and latency stats. Trainers click Start Looping to enter the queue and claim individual loops for review.



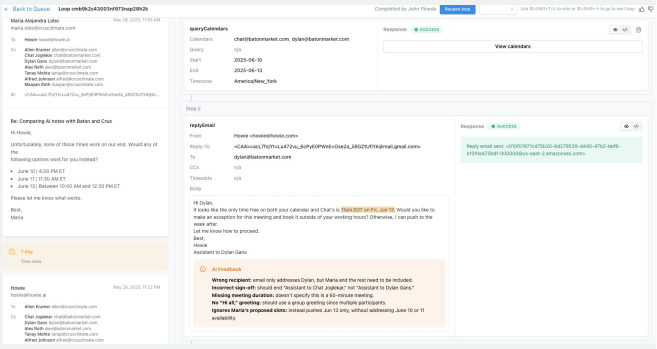
Loop Review — Calendar Query & Event Creation

Each loop displays the email thread on the left and AI-predicted tool calls on the right. Here: queryCalendars checks Erik's availability, then createEvent schedules the meeting with correct attendees, times, and a Google conferencing link.



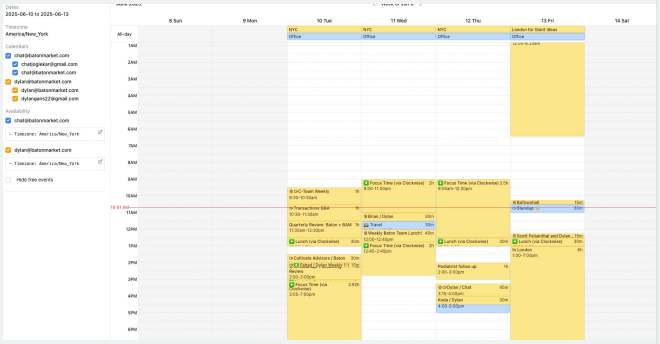
Loop Review — Reply Email & AI Feedback

After verifying the calendar event, replyEmail confirms the booking to both parties. The orange AI Feedback banner flags issues I caught and corrected — e.g., greeting that only addressed one attendee despite two being on the invite.



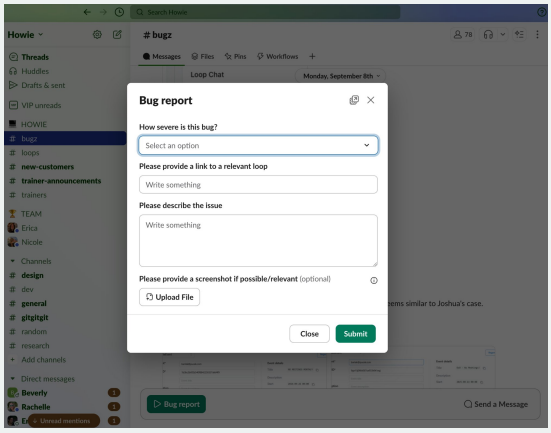
Complex Loop — Multi-Attendee Scheduling

A more involved loop involving multiple CCs across two companies. AI Feedback identified five separate errors including wrong recipient, incorrect sign-off, missing meeting duration, and ignored guest availability slots — all corrected before submission.



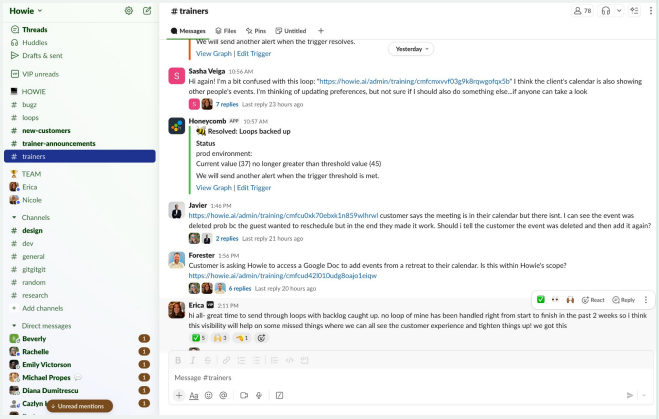
queryCalendars — Availability Check

The queryCalendars tool fetches a client's full calendar for a specified date range and timezone. I use this to verify open slots before proposing or booking any meeting time.



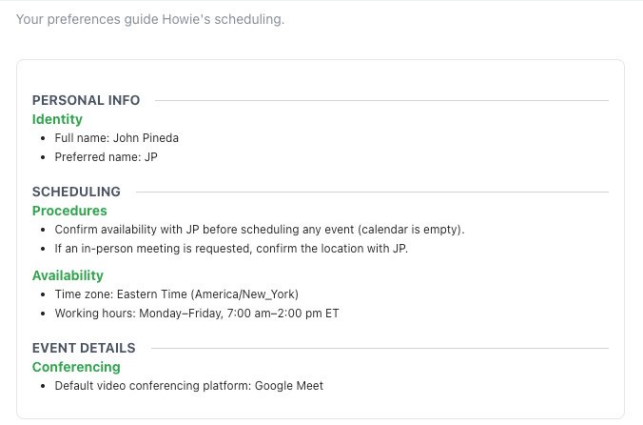
Bug Reporting via Slack Workflow

When systemic issues are found, I submit a structured bug report — rating severity, linking the relevant loop, describing the issue, and attaching screenshots — so engineers can prioritize and resolve it quickly.



#Trainers Slack Channel — Team Collaboration

The shared trainer channel for real-time collaboration: discussing tricky loops, sharing announcements, flagging backlog alerts (Honeycomb notifications), and resolving ambiguous scheduling scenarios as a team.



Client Preference Guide

Each client has a preference profile that guides Howie's behavior — including their identity, timezone (Eastern Time), working hours, scheduling procedures, and default conferencing platform (Google Meet).

SKILLS & TOOLS

Scheduling & Calendar

- queryCalendars · createEvent · updateEvent · deleteEvent
- Google Calendar API (via Howie platform)
- Timezone-aware scheduling (multi-zone support)
- Conflict detection & resolution

AI Training & QA

- Tool call validation and correction
- AI Feedback review and error categorization
- Loop queue management and latency monitoring
- Structured bug reporting with severity tagging

Communication

- replyEmail / startEmailThread tool calls
- Professional email writing (tone, sign-offs, formatting)
- Multi-party thread management
- Timeslot formatting and time zone clarity

Technical

- JSON file inspection for calendar data
- SQL queries for scheduling validation
- Slack for real-time collaboration
- GitHub (push, pull, basic git operations)

IMPACT & CONTRIBUTIONS

■ Accuracy at Scale

Maintained high accuracy standards across all resolved loops by validating every AI tool call against live calendar data, email threads, and client preferences.

■ Bug Detection & Reporting

Proactively identified and reported systemic AI errors via Slack's structured bug workflow, enabling the engineering team to patch recurring scheduling failures.

■ Team Collaboration

Actively participated in the #trainers channel to help peers resolve ambiguous loops, share edge cases, and keep the backlog moving efficiently.

■ Client-Ready Communication

Ensured every outbound email met professional standards: correct names, timezones, sign-offs, and formatting — representing clients accurately to their guests.
